

```
#rent calculator in python
```

```
## Inputs we need from the user
```

```
# Total rent
```

```
# Total food ordered for snacking
```

```
# Electricity units spend
```

```
# Charge per unit
```

```
# Persons living in room/flat
```

```
## Output
```

```
# Total amount you've to pay is
```

```
rent = int(input("Enter your hostel/flat rent = "))
```

```
food = int(input("Enter the amount of food ordered = "))
```

```
electricity_spend = int(input("Enter the total of electricity spend = "))
```

```
charge_per_unit = int(input("Enter the charge per unit = "))
```

```
persons = int(input("Enter the number of persons living in room/flat = "))
```

```
total_bill = electricity_spend * charge_per_unit
```

```
output = (food + rent + total_bill) // persons
```

```
print("Each person will pay = ", output)
```
